

Probability Review and Normal Distribution

Mainak Thakur

17.08.2020

Jointly Distributed Random Variables

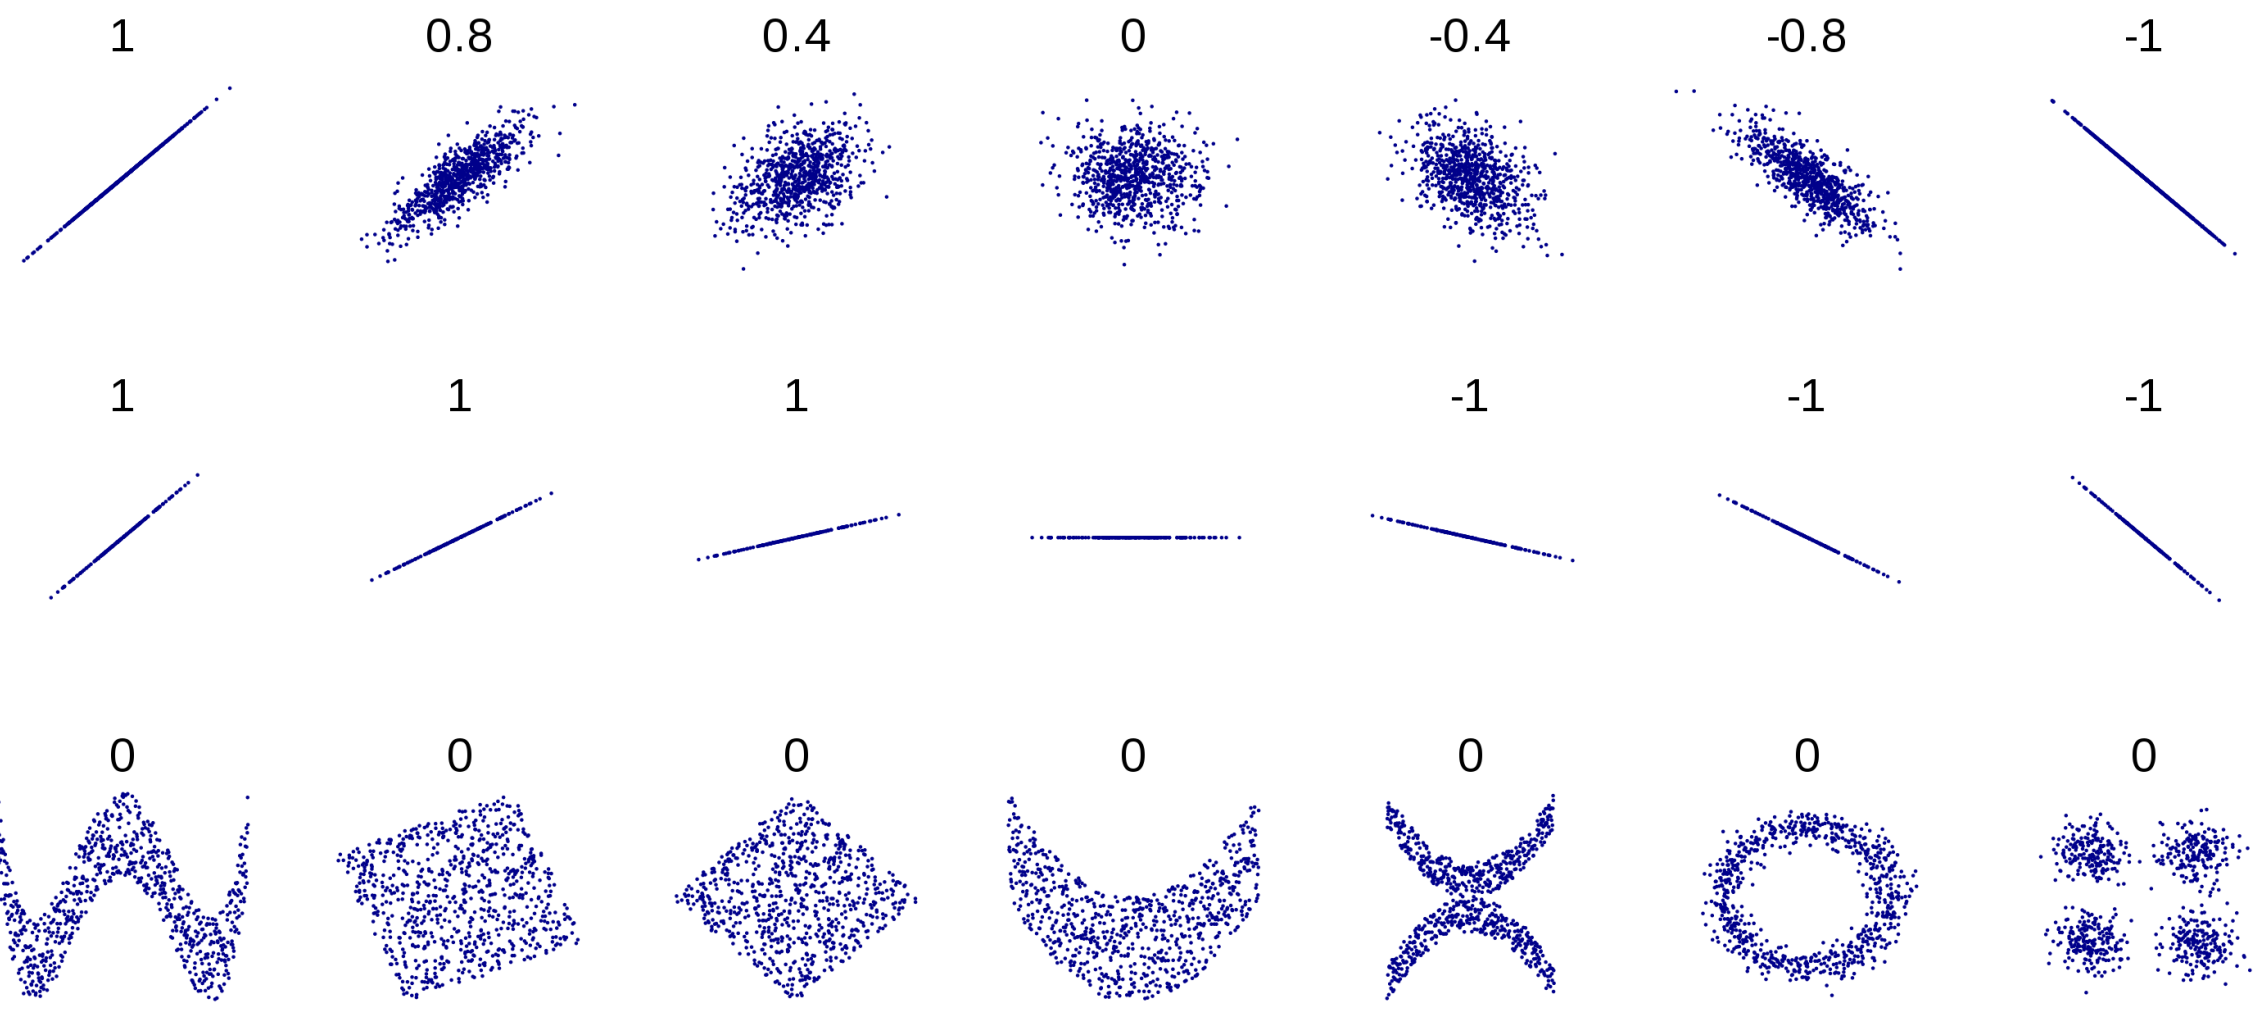

- Joint pmf: $f(x,y) = P(X = x, Y = y)$.
- Covariance: **covariance** is a measure of the joint variability of two random variables.
$$\text{Cov}(X, Y) = \sigma_{X,Y} = E[(X - \mu_X)(Y - \mu_Y)] = E(XY) - E(X)E(Y)$$
- Independence: $E(XY) = E(X)E(Y)$ implies $\text{Cov}(X, Y) = 0$.
- $\text{Cov}(X, Y) = 0$ does not imply independence.
- Correlation: normalized covariance to maintain the range to be $[-1, 1]$:

$$\rho_{X,Y} = \frac{\text{cov}(X, Y)}{\sigma_X \sigma_Y}$$

Correlation doesn't imply cause and effect relationship

Both ice cream sales and shark attacks increase when the weather is hot and sunny, but they are not caused by each other (they are caused by good weather, with lots of people at the beach, both eating ice cream and having a swim in the sea)

Normal Distribution

- Most widely used distribution, approximates several natural occurrences quite well, a standard reference for many probability problems
- Continuous distribution, bell shaped and symmetric
- Everything about the normal random variable is known once the two parameters μ and σ are known.

$$f(x; \mu, \sigma^2) = \frac{1}{\sqrt{2\pi\sigma^2}} e^{-(x-\mu)^2/2\sigma^2}$$

Normal Distribution

Standard Normal Distribution:

$$X \sim N(\mu, \sigma^2)$$

$$Z = \frac{X - \mu}{\sigma} \sim N(0, 1)$$

Use Standard Normal Table

Convert back to original scale: $X = Z\sigma + \mu$

$P(a < X < b) = ?$ In terms of Z ?

Normal Distribution

Standard Normal Distribution:

$$X \sim N(\mu, \sigma^2)$$

$$Z = \frac{X - \mu}{\sigma} \sim N(0, 1)$$

Use Standard Normal Table

Convert back to original scale: $X = Z\sigma + \mu$

$$P(a < X < b) = P([(a - \mu)/\sigma] < Z < [(b - \mu)/\sigma])$$

Normal Distribution

Standard Normal Table

Standard Normal Cumulative Probability Table

Cumulative probabilities for NEGATIVE z-values are shown in the following table:

z	0.00	0.01	0.02	0.03	0.04	0.05	0.06	0.07	0.08	0.09
